Quantum measurement influences the past, with Avshalom Elitzur

Time and consciousness in quantum physics

18th August 2026

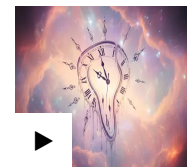

We think that the future follows the past; causes precede effects. But theoretical physicist Avshalom Elitzur argues that quantum physics alters our conception of time and causation: a measurement done in the present influences not only the future, but the past. In this conversation, he explores the radical implications of quantum theory for the nature of time and consciousness, as well as what the future holds for physics.
